

U.S. Stock Market Week in Review (Oct 13–17, 2025) and Outlook for Oct 20–24, 2025

Week of Oct 13–17, 2025: Earnings Highlights and Inflation Insights

Robust Bank Earnings Amid Inflation Concerns: Major U.S. banks kicked off Q3 earnings with stronger-than-expected profits. **JPMorgan Chase (JPM)** handily beat forecasts with EPS of \$5.07 (vs. \$4.84 estimate) ¹, boosted by a record \$8.9billion in trading revenue (up 25%) ². CEO Jamie Dimon noted the U.S. economy “remained resilient,” but warned of “**sticky inflation**” and uncertainty from tariffs and geopolitics ³. Despite the solid results, JPM shares dipped ~1.7% as management flagged rising expenses ahead ⁴. **Citigroup (C)** likewise beat expectations – adjusted EPS \$2.24 vs. \$1.90 consensus ⁵ – with record revenue across all divisions. CEO Jane Fraser credited a “humming” U.S. economic engine underpinned by consumer spending ⁶. Citi stock jumped over 4% on the news ⁷. **Bank of America (BAC)** and **Wells Fargo (WFC)** also topped profit estimates, aided by a 40% surge in investment banking fees amid a rebound in M&A deals ⁸. BofA’s CFO observed that low unemployment, solid wage growth, and high home prices are keeping consumers and businesses healthy ⁹. Notably, BofA raised its net interest income outlook and saw its stock rise ~5% ¹⁰. **Morgan Stanley (MS)** delivered one of its best quarters ever – EPS \$2.80 vs. \$2.10 est. on **record** \$18.2billion revenue ¹¹ – thanks to a 44% jump in investment banking fees and continued growth in its wealth management arm ¹² ¹¹. MS shares surged ~6–7% to all-time highs ¹³, with executives noting **optimism around interest rate cuts** and a strong deal pipeline at “all-time highs” going into 2026 ¹⁴. Across these financials, management commentary suggested the **inflation picture is mixed**: consumers remain resilient (helping loan and card volumes), but banks are watching for any “softening” in the labor market. Dimon in particular flagged the “risk of sticky inflation” as a lingering concern ³ even as price pressures have eased modestly in some areas.

Asset Management & Credit: **BlackRock (BLK)**, the world’s largest asset manager, reported a higher profit and record assets under management of \$13.46 trillion in Q3 ¹⁵ ¹⁶. Adjusted EPS of \$11.55 beat estimates (consensus ~\$11.24) on \$6.5billion revenue ¹⁷. BlackRock saw \$205 billion of total net inflows as equity markets rallied ¹⁸ ¹⁹. Notably, management pointed out that moderating inflation and a cooling labor market prompted the Fed’s September rate **cut**, which in turn fueled big inflows into BlackRock’s bond ETFs ²⁰. This underscores how **cooling inflation trends** (and expectations of policy easing) are benefiting firms like BlackRock. **American Express (AXP)** posted record Q3 revenue of \$18.4billion (+11% YoY) and EPS \$4.14, beating consensus by ~4% ²¹. The credit card giant raised its full-year guidance, now seeing 2025 EPS of \$15.20–\$15.50 (up from \$15.00+), citing **steady spending** among affluent consumers despite higher prices ²². AXP reported continued strength in travel and entertainment spending, indicating that **service-sector inflation** (e.g. airfare, hotels) hasn’t deterred its high-end customer base. Executives did note some increased caution in the economy, but so far luxury demand remains robust – an inflationary signal in that wealthier consumers are absorbing higher prices. Overall, the financial sector’s results suggest **inflation is not severely crimping demand** yet. Instead, banks and lenders are enjoying the benefits of prior rate hikes (higher interest income) while keeping credit quality stable, and they see the economy as resilient if inflation can be guided down gradually ³ ²³.

Healthcare and Consumer: In healthcare, **Johnson & Johnson (JNJ)** beat forecasts and **raised its outlook** but faced other headwinds. J&J's adjusted EPS came in at \$2.80 (vs. \$2.76 est.) on \$23.99 billion revenue (+6.8% YoY) ²⁴ ²⁵ . The company nudged its 2025 sales forecast up by ~\$300 million and now sees 2026 growth >5% ²⁶ ²⁷ . However, J&J's stock fell ~2% on news it will **spin off its orthopedics business** and on revived concerns about trade tariffs. Management revealed it has **halved its expected 2025 tariff costs** to ~\$200 million thanks to the Trump administration's pause on certain China duties ²⁸ ²⁹ . That positive development suggests some relief in medical device input costs. But looking ahead, Trump's new tariff threats (see below) – which could hit medical equipment – cast a cloud. J&J's CFO said it's too soon to predict 2026 tariff impacts given the fluid trade environment ³⁰ . This illustrates how swiftly trade-policy shifts (a driver of **import price inflation**) can alter corporate cost forecasts. On the consumer front, discount retail and travel told an interesting inflation story. **Dollar Tree (DLTR)** held an investor day that sent its stock up ~4% ³¹ after the company **upbeatly forecast** high-teens percentage EPS growth for fiscal 2026, above Wall Street's ~14% expectation ³² . Dollar Tree reaffirmed its current quarter and 2025 guidance ³³ , projecting steady demand as inflation pressures shoppers. Management noted that with budgets squeezed by “the highest inflation in decades,” more middle- and high-income consumers are bargain-hunting at dollar stores ³⁴ . In other words, **inflation is driving trade-down behavior**, boosting traffic for discounters. At the same time, Dollar Tree is contending with higher costs: it warned that tariffs on imported goods have shifted more cost pressure into late 2025, though the CEO said they're mitigating this by diversifying sourcing and selectively raising prices ³⁵ . This balancing act – passing along some costs while absorbing others – will influence **future inflation** in consumer goods.

Travel and Transport: United Airlines (UAL) delivered strong results and guidance, highlighting both pricing power and cost inflation in travel. United's adjusted EPS was \$2.78, topping consensus \$2.63 ³⁶ , although revenue of \$15.2 billion came in just shy of forecasts ³⁷ . Notably, United forecast **its highest-ever quarterly revenue** in Q4 and guided a robust \$3.00–\$3.50 EPS for next quarter (midpoint ~\$3.25, well above analysts' \$2.86 estimate) ³⁸ ³⁹ . The airline cited rising demand and improved pricing – its premium cabin and corporate travel revenues jumped ~6–9% as travelers show willingness to pay higher fares ⁴⁰ . United (and peer Delta) have been able to **raise ticket prices** thanks to industry-wide capacity cuts and strong premium demand, a clear contributor to **service-sector inflation** ⁴¹ . CEO Scott Kirby noted that a shortage of airline seats (partly due to a competitor's bankruptcy and capacity discipline across carriers) has “driven up ticket prices, bolstering the industry's revenue outlook” ⁴¹ . This has a dual effect: it's great for airline earnings, but it means **airfares remain a sticky inflation component** for consumers. On the flip side, budget carriers are struggling – an **earnings divide** that reflects how inflation and higher fuel costs are pressuring lower-margin players ⁴² . United's results also remind us that fuel prices (which spiked over the summer) and labor expenses (after new union contracts) are key cost inputs. So far, demand and pricing power are offsetting those costs, but if jet fuel or wages climb further, airlines may be forced to hike fares even more – feeding back into inflation.

Bottom Line – Earnings and Inflation: The past week's earnings overall painted a picture of an economy handling inflation **better than feared**. Companies from banks to manufacturers to airlines generally **beat earnings estimates**, showing they can **pass on higher costs or find efficiencies**. In several cases, executives explicitly linked their performance to inflation trends: e.g., BlackRock benefited from hopes that inflation is cooling (rate cuts), while Dollar Tree benefited from inflation driving frugal behavior, and banks noted strong spending despite past price increases. Many management teams expressed cautious optimism that inflation is moderating, but none declared victory yet. The consensus view is that **U.S. inflation is gradually easing but not yet tamed**. This aligns with the macro data: CPI has come down from 2022 peaks but remains above target, and the Fed is still vigilant. Crucially, the varied earnings results suggest **inflation's impact is uneven**

– robust in services/travel and wages, softer in goods and supply chains. That nuance was echoed by Fed Chair Powell’s speech (see below). Taken together, last week’s earnings and commentary support a forecast that **inflation will continue to decelerate slowly** into 2024, barring a shock. Companies are not seeing rampant new price surges (in fact, some input costs are stabilizing), but neither are they seeing full relief on expenses. This corporate experience reinforces the expectation that **inflation will trend lower** but could **plateau above 2%** for a while – a “higher for longer” inflation regime that keeps the Fed cautious.

Key Economic Events Last Week

Fed Chair Powell’s Dovish Hints Boost Bonds: In a closely watched speech on Oct. 14, Fed Chair **Jerome Powell** provided an update on the economic outlook that markets cheered. Powell noted that the labor market, while still tight, has cooled to “low-hiring, low-firing doldrums,” and the overall economy “may be on a somewhat firmer trajectory than expected” ⁴³. Importantly, he stressed the Fed will proceed “meeting by meeting” on any further rate changes, balancing job market weakness against still-above-target inflation ⁴⁴. Notably for markets, Powell **hinted at an end** to the Fed’s balance sheet runoff (quantitative tightening): the conclusion of QT “may be coming into view” in the coming months ⁴⁵. This was new information that investors interpreted as a dovish signal. The **market reaction** was swift: **Treasury yields fell**, with the 10-year yield dropping to ~4.02% (down from recent highs) ⁴⁶. **Stocks** initially turned positive – the Dow and S&P 500 climbed, while the Nasdaq ended slightly down – reflecting a rotation into rate-sensitive value stocks ⁴⁷. The **U.S. dollar** likewise slipped to a two-month low, with the DXY index down about 0.3% on the day to ~99.0 ⁴⁸. Analysts noted that an early end to QT could ease upward pressure on long-term interest rates, which is “a hidden source of relief – especially to homeowners – that rate cuts alone may not deliver,” as Ritholtz Wealth’s Callie Cox explained ⁴⁹. Powell’s overall tone was cautious but not hawkish: he acknowledged progress on inflation **without** signaling any desire to tighten policy further in the near term. He even repeated that there is “no risk-free path” for policy now ⁵⁰ – meaning the Fed must be careful not to harm growth or let inflation fester. This balanced stance, combined with the QT comments, helped soothe markets after weeks of bond sell-offs. In summary, **Powell’s speech calmed equities and bonds** by reinforcing expectations that the Fed is likely done raising rates and may soon pause QT – conditional on inflation continuing to trend down. The yield and dollar declines show markets believe Powell is leaning dovish, given signs of economic softening and the Fed’s success so far in reducing inflation from its peak.

Trade Tensions Flare, Then Ease – Markets Whipsaw: President **Donald Trump’s** surprise tariff threats on China sparked volatility last week, underscoring the market’s sensitivity to trade policy. Early in the week, Trump **announced** he would impose an **additional 100% tariff** on all Chinese imports starting Nov. 1 unless Beijing reversed its new export bans on rare-earth metals ⁵¹. This hardline stance rattled investors – such an across-the-board tariff doubling would significantly raise costs on a vast array of consumer and industrial goods, essentially acting as a massive **tax on U.S. import prices**. The immediate market reaction was risk-off: U.S. stock indexes swooned early in the week, and safe-haven assets like Treasuries caught a bid. Companies reliant on Chinese imports (from electronics to retail) sold off on fear that supply chain inflation would spike if these tariffs materialize. However, by Friday the tone dramatically shifted. **Treasury Secretary Scott Bessent** (a key figure in trade negotiations) announced he will meet Chinese Vice Premier He Lifeng next week to **forestall an escalation of tariffs** ⁵². He characterized Trump’s 100% tariff threat as a bargaining tool and later confirmed that **direct talks are resuming** in Malaysia to extend the existing tariff truce beyond its Nov. 10 expiry ⁵³. Crucially, Trump himself appeared to **soften** his stance in a Fox Business interview: when asked about the 100% tariff, he admitted “It’s not sustainable, but that’s what the number is” ⁵⁴. He went on to express optimism for a meeting with China’s President Xi Jinping in two weeks and praised Xi, saying “we like talking to China” ⁵⁵ ⁵⁶. This climbdown – essentially signaling that the most

extreme tariffs might not actually take effect – **relieved markets**. Wall Street’s early-week losses reversed, and by Friday afternoon the S&P 500 and Dow were up, snapping back from the trade scare ⁵⁷. A major factor was the perception that Trump’s threats were a negotiating tactic and that cooler heads (including the WTO urging de-escalation) would prevail ⁵⁸. Analysts pointed out that a **full US-China trade rupture** could reduce global GDP by ~7% in the long run ⁵⁸ – a lose-lose outcome both sides are keen to avoid. Indeed, the WTO and IMF officials have been actively encouraging dialogue ⁵⁹. By week’s end, the narrative shifted to one of potential resolution: Bessent’s planned talks and Trump’s “not sustainable” comment suggest the U.S. may settle for a smaller-scale agreement (or delay tariffs) if China compromises on rare-earth exports ⁵¹ ⁶⁰. In summary, the tariff flare-up caused a bout of volatility – highlighting that **trade policy remains an external inflation wildcard** (tariffs directly raise prices of imports). But the subsequent calming of rhetoric allowed markets to stabilize. From an investor standpoint, the episode reinforced that **any major trade escalation would be a stagflationary shock** (higher prices, lower growth), while avoidance of a trade war is a bullish outcome. U.S. equities ultimately shrugged off the scare, ending the week higher as trade tensions appeared to cool. However, this remains a live issue: traders will be watching next week’s U.S.-China meetings and any Trump/Xi headlines carefully.

Week of Oct 20–24, 2025: Key Data Releases to Watch

The coming week features **critical economic releases** that could shape the market’s inflation outlook and Fed expectations, as well as another packed earnings calendar. Below are the major reports due Oct. 20–24 and what they might mean:

- **Consumer Price Index (Sept)** – Rescheduled to Friday, Oct. 24 due to the earlier government shutdown. This is the week’s marquee data. **Consensus expects headline CPI to reaccelerate to ~+3.1% YoY** (from 2.9% in August) with a monthly increase of ~0.3% ⁶¹ ⁶². Core CPI (ex-food & energy) is forecast to hold around **+3.1% YoY** ⁶², implying core prices rose roughly 0.3% on the month. Investors will parse this report intensely: a **hotter-than-expected CPI** (say, core coming in higher or an upside surprise in services inflation) could rekindle fears that the Fed might need to rethink its pause, likely triggering a rise in Treasury yields and pressure on tech/growth stocks. Conversely, if **inflation comes in cooler** – for instance, core CPI printing under 0.2% MoM – it would bolster the case that the disinflation trend is intact. That outcome could spark a **rally in bonds and equities**, as it would increase confidence that the Fed is done hiking (or even leaning toward cuts). Goldman Sachs economists expect a moderate +0.26% core CPI increase for September ⁶², noting that prior private surveys have shown easing price pressures. Key components to watch include **rent inflation** (expected to continue slowing gradually) and **car prices** (which could fall). This CPI release is especially important because it’s one of the last inflation readings before the Fed’s Oct. 28–29 meeting – a big **input for the Fed’s decision making** ⁶³.
- **Initial Jobless Claims** (week ending Oct. 18, report due Thu Oct. 23) – The labor market’s weekly pulse. Claims have been low but creeping up slightly in recent weeks. Consensus is around **230,000 new claims**, roughly in line with the prior ~225k level (i.e. still historically low). A higher number (e.g. >250k) would indicate some cooling in employment – potentially good news for markets if it signals less wage inflation pressure, though too high could raise growth concerns. Conversely, claims staying ultra-low (<210k) might suggest the labor market remains very tight, which could worry the Fed. Last week’s Powell commentary implied the Fed is comfortable with a bit of labor market softening. Thus, **investors may actually cheer a modest rise in claims** as a sign that the job market is loosening (taking pressure off inflation) without collapsing. Overall, unless there’s a big surprise, this weekly

data usually only moves markets modestly, but it feeds into the narrative on how sticky wage inflation might be.

- **Existing Home Sales (Sept)** (Thu Oct. 23) – The National Association of Realtors will report on sales of existing homes, which have been running at depressed levels due to **7%+ mortgage rates**. In August, existing home sales were about 4.00 million annualized units ⁶⁴ – near a multi-year low. For September, the **forecast is ~3.9–4.0 million** SAAR, essentially flat to a slight decline. High financing costs and limited inventory (many homeowners locked in low rates and unwilling to sell) have crimped activity. If the number significantly **undershoots** (say, <3.8M), it might spook markets about housing sector weakness – but it also underscores that housing-driven inflation (think home furnishings, broker commissions in CPI) is cooling. A **surprise rise** in sales, on the other hand, could indicate buyers are adapting, which might boost homebuilder stocks but could also imply housing demand (and prices) aren't slowing as the Fed wants. Notably, home prices nationally have remained resilient (even rising YoY) despite fewer transactions ⁶⁵. From an inflation standpoint, weak home sales and construction have been a drag on GDP, but they also mean **less demand-pull inflation** in related sectors. Investors will also watch **median home price** data in this release – last month it was ~\$407k, a couple percent higher YoY, reflecting how low supply is propping up prices ⁶⁶.
- **New Home Sales (Sept)** (Fri Oct. 24) – In contrast to existing homes, **new home sales** (from the Census Bureau) have been comparatively stronger, as homebuilders fill the gap in inventory. August new home sales were ~715k annualized. Consensus for September is around **700k** (slight dip). Homebuilders have been benefiting from strategies like mortgage rate buydowns and incentives to attract buyers, effectively offsetting some affordability issues. If new home sales substantially **beat expectations**, it would suggest the housing market is finding a footing – a positive for construction and real estate equities, but it might also point to **continued inflation in housing** (since new home prices and construction costs remain elevated). A weaker figure, however, would align with other data showing housing is a soft spot. Given housing's weight in the economy, investors see these reports as **leading indicators**. But any impact on broader markets will also hinge on how mortgage rates are behaving (recently above 7%, highest since 2000).
- **S&P Global Flash PMIs (Oct)** (Fri Oct. 24) – These preliminary Purchasing Managers' Index surveys for October will offer a **timely read on economic momentum** in both the U.S. and Europe. For the U.S., the last flash PMI (September) showed the composite index barely above 50 (borderline expansion) with manufacturing in contraction and services growth slowing. **Expectations for October's PMI** are muted – perhaps a small uptick in manufacturing from very weak levels, and services holding in expansion but not by much. Markets will watch if U.S. **Manufacturing PMI** finally ticks up above 50 (signaling expansion) or remains sub-50 (contraction). An improving PMI, especially driven by new orders, could indicate the Fed's soft-landing scenario is playing out (growth holding up as inflation eases). However, too strong a reading might rekindle talk of economic re-acceleration – not ideal when the Fed is trying to cool things off. In Europe, where PMIs will also be released, recent readings showed a rebound in Eurozone activity to a 16-month high ⁶⁷. Any continued strength in European PMIs could be a positive sign for global demand (helping U.S. multinationals), but Europe's improvement also raises questions on **price pressures** abroad. Overall, the PMI day on Friday could add some volatility in currency and bond markets in the morning. The prices sub-index within these PMIs will be scrutinized as a leading signal on inflation – last month U.S. firms reported some easing of price pressures, partly due to **currency gains reducing import costs** ⁶⁸. If that trend continues in October's survey (e.g. input price index falls), it bodes well for future CPI prints.

- **Other Data:** A few additional reports round out the week. **Core CPI (MoM/YoY)** will come with the CPI release – core YoY is expected ~3.1% as noted, and monthly core inflation around 0.2–0.3%. Also on Friday, the final **University of Michigan Consumer Sentiment (Oct)** is due – important for insight into household inflation expectations. Any jump in long-term inflation expectations in that survey could worry the Fed. Housing data continues with **New Home Sales** (as above) and possibly **FHFA Home Price Index** earlier in week (to gauge house price inflation). Lastly, **Initial Claims** (Thursday) we discussed, and **Continuing Claims** will show if any trend up in unemployment claims is emerging. All told, it's a week heavy on **inflation indicators** and **growth signals**. Markets will likely take their cue from the CPI report most of all, with PMI and housing data as secondary influences.

Major Earnings to Watch (Oct 20–24, 2025)

Another wave of influential companies report Q3 results this week. These include a set of **inflation-sensitive consumer and industrial names**, as well as big players in **tech and AI**. Below we preview some of the most important earnings and the expectations around them:

Consumer & “Inflation Plays”: Several firms in this category will shed light on how inflation is affecting costs and consumer behavior:

- **Coca-Cola (KO)** – Reports Tuesday, Oct. 21. The beverage giant is expected to post solid results driven by its pricing power. Wall Street consensus sees **EPS around \$0.78** (up ~1% YoY) on revenue of **\$12.4 billion** (+4.9% YoY) ⁶⁹. Coca-Cola has implemented price hikes over the past year (e.g. higher soda prices in grocery and restaurant channels) to counter rising input costs. Investors will be watching volume trends: last quarter, Coke's unit case volumes were soft, suggesting consumers drank slightly less as prices rose. If Q3 volumes are flat to down but earnings still beat, it means Coke managed to **expand margins via pricing** – potentially an inflationary sign (consumers accepting higher prices). The company guided that currency should be a ~1% revenue headwind in Q3 ⁷⁰, and it flagged a 5–6% EPS headwind from foreign exchange (strong dollar) ⁷⁰. Excluding that, underlying growth is robust. **Key focus:** any commentary on commodity costs (sweeteners, aluminum, plastics) and whether Coke plans further price increases. Thus far, demand has been resilient – especially for Coke's premium brands – indicating inelastic demand even as prices climbed, which is a microcosm of broader **consumer staples inflation**. Analysts generally expect an in-line quarter; the stock has a Zacks Rank #4 (Sell), reflecting some recent estimate downgrades ⁷¹. But if Coke reports a volume pickup or raises its full-year outlook, it could surprise to the upside. Conversely, any hint that consumers are downtrading to cheaper alternatives (or that retailers are pushing back on pricing) would be a red flag for the staples sector. Keep an eye on Coke's outlook for 2025 – as an iconic staple, its guidance will influence perceptions of **whether inflation in groceries is set to cool or persist**.
- **3M Company (MMM)** – Reports Wed, Oct. 22. This diversified manufacturer (from Post-it notes to industrial adhesives) is seen as an economic bellwether. **Consensus forecasts EPS of roughly \$2.10** on revenue of about **\$6.25 billion** ⁷². That would be a modest decline from \$2.31 EPS a year ago, as 3M has faced slower demand in some segments and various one-time costs. Crucially, 3M's results will reflect manufacturing cost inflation dynamics. Over the past couple of years, 3M was hit by surging raw material and freight costs; now many input prices (resins, chemicals) have come down from peaks, which should help margins. Indeed, 3M's Q2 saw a 12% EPS jump and it raised its full-year guidance to \$7.75–\$8.00, partly on improved supply-chain conditions ⁷³. This quarter, investors expect execution on those targets. **Expert sentiment:** fairly optimistic – the stock has many “Buy”

ratings ⁷⁴ , implying analysts think 3M can at least meet expectations. If 3M **beats and raises guidance** again, it would signal that industrial inflation is easing (lower input costs boosting profits) and that demand is holding up. One big wildcard: 3M's legal liabilities (earplugs, PFAS chemicals) – any large charges could affect reported earnings. But excluding those, core trends like automotive and manufacturing output will drive results. **What to watch:** 3M's commentary on pricing. They have been incrementally raising prices to offset costs; if they now say “cost pressures have abated and we're moderating price increases,” that would be a welcome sign for downstream customers (and disinflationary). Alternatively, if 3M still sees wage or material inflation requiring further price hikes, that suggests **inflationary pressure in the industrial supply chain** hasn't fully passed. Also, China is a notable market for 3M – any recovery or weakness there (due to China's economy and tariffs) will be noted. Overall, a steady showing from 3M would reinforce the narrative of **cooling goods inflation** and resilient industrial activity.

- **General Motors (GM)** – Reports Thursday, Oct. 23. The auto industry has been a hotbed of inflation, with vehicle prices at record highs in recent years. GM's Q3 earnings will reveal how it's coping with a new UAW labor deal and the EV transition. Analysts project **EPS around \$2.30** (down ~21% YoY) on **~\$45 billion in revenue** (roughly flat YoY) ⁷⁵ . The big story: GM's profit margins are under pressure. Unit sales have been solid (GM already reported a 21% surge in Q3 U.S. vehicle deliveries YoY), but costs are rising. The new union contract (settled earlier this month after the Q3 quarter-end) significantly boosts labor costs over the next four years – investors will look for any **guidance updates** on how that impacts 2024 earnings. In Q3 specifically, GM likely faced higher **material costs** (steel, etc.) and ramp-up costs for EV production. It's also been aggressive on incentives for EV models that haven't been selling as briskly (which could reduce transaction prices – a deflationary force in autos). **Key focus:** vehicle pricing and inventory. New car prices remain very high industry-wide (the average transaction price is ~\$48k). If GM managed to hold prices firm despite higher incentives, it means consumer demand is still strong enough to bear it – keeping **auto inflation elevated**. However, any signs of price cuts or excess inventory (especially in EVs) could indicate a turning point where competition is driving disinflation in autos. Another angle: **financing costs** – with interest rates up, more buyers are getting priced out or shifting to used cars. We'll see if GM Financial's results (their financing arm) show strain (e.g. lower loan origination, higher delinquencies) ⁷⁶ . As for beating/missing: GM has a mixed track record. Recently, some analysts have trimmed forecasts given the strike impact and EV costs. Zacks notes a downward trend in estimates, and the consensus view is that **earnings will be down year-over-year** ⁷⁷ . A **beat** could come if GM was very effective in cost discipline or if truck/SUV sales (its profit center) were richer than expected. Conversely, a **miss** might occur if EV losses were larger or if the strike (which started late in Q3) dinged production more than anticipated. For markets, GM's outlook on 2024 will be crucial – especially any quantification of how a ~25% labor cost jump will be offset. If they indicate raising car prices further to cover costs, that's an **inflationary signal** for the auto market (consumers ultimately foot the bill). On the other hand, if demand is softening, automakers might have to eat some costs and accept lower margins – implying less inflation pass-through. GM's results will thus contribute to the debate: have car prices peaked? Or will supply constraints (and now higher labor costs) keep them elevated?

- **Hilton Worldwide (HLT)** – Reports Wednesday, Oct. 22. This will be a key report for the travel and hospitality sector. Hotel room rates have been surging (especially in leisure destinations) – a clear component of **services inflation**. Hilton, as a major hotel operator/franchisor, has likely benefited from this trend. Analysts expect a strong quarter; though specific consensus EPS isn't quoted here, the focus will be on **RevPAR** (revenue per available room) growth. In Q2, Hilton's systemwide RevPAR was

up double-digits %, and it raised its full-year outlook. For Q3, continued robust travel demand (summer season) likely pushed RevPAR higher again. **Things to watch:** Hilton's **pricing power** – were they able to continue raising room rates at or above inflation? U.S. hotel rates have hit record highs in many markets, contributing to CPI. If Hilton reports, say, RevPAR +8–10% (with a significant chunk from higher rates), it underscores that **hospitality inflation** is still running hot. Conversely, any sign of **demand normalization** – e.g. fall bookings slowing, or more discounting needed to fill rooms – would suggest that this pandemic-driven travel boom is leveling off (which would be disinflationary for services). Leisure travel has been strong, while business travel recovery is more tepid; Hilton's mix (lots of urban and convention hotels) means corporate demand is important. Management commentary on forward bookings, business travel budgets, and international traveler trends will be important. From an earnings beat perspective, hotel companies have often beat estimates this year due to higher-than-modeled pricing. It wouldn't be surprising if Hilton beats and maybe nudges guidance up, given the summer travel strength. However, the stock reaction will hinge on **guidance for 2026**. If they caution that next year growth might slow (perhaps because comparisons get tough or if consumer savings are drawn down), it could temper enthusiasm. All in all, Hilton's report will give a read on **service sector inflation persistence** – lodging was a big contributor to core CPI in early 2023, though it has moderated in recent months. If Hilton is still seeing high-single-digit rate growth, the Fed will take note that some parts of core services remain heated.

- **American Airlines (AAL)** and **Southwest Airlines (LUV)** – Both report Thursday, Oct. 23. These two large U.S. airlines represent the more price-sensitive segment of air travel (domestic economy and budget travelers). Their results will complement United's report by showing the **other side** of the airline industry. Notably, analysts expect **much weaker earnings** from these carriers compared to a year ago. **American Airlines** is projected to roughly break even; some forecasts even have a small **loss** (~-\$0.25 EPS) for Q3 ⁷⁸ versus a +\$0.30 profit in Q3 2024 ⁷⁸. **Southwest** is similarly forecast around **-\$0.02 to -\$0.04 EPS** ⁷⁹, down from +\$0.15 last year ⁷⁹. Why the downturn? Two main factors: **fuel and labor costs**. Jet fuel prices rose sharply over the summer – oil spiked above \$90, so Q3 fuel expense will be much higher YoY for all airlines. And labor contracts: American gave hefty raises to pilots (40%+ increases) and other staff, and Southwest also reached new labor deals. These cost pressures hit the low-cost and domestic-focused airlines hardest because they can't offset as easily with high-premium revenues. As a result, **margins are getting squeezed**, and these airlines have had to temper capacity growth plans. The interesting dynamic is **airfare pricing**: United and Delta have managed to keep fares high (especially for premium seats) and remain profitable, but airlines like AAL and LUV, which cater more to price-sensitive flyers, have faced **yield pressure** – essentially, they haven't been able to raise economy ticket prices enough to fully cover costs, as budget-conscious consumers push back. We will see in AAL/LUV's revenue per passenger metrics whether they were able to pass on any of the higher fuel costs through surcharges or higher fares. So far, it appears **"budget" airfares are under competitive pressure**, which in a way is disinflationary for the consumer (good news for travelers, bad for airline profits). **Market expectations:** given the consensus of near-zero earnings, any small profit would count as a beat. It's possible, for example, that American Airlines ekes out a slight positive EPS if late summer demand was stronger than expected or if operational performance improved (fewer cancellations, etc.). Southwest has been struggling with cost overruns and a slower recovery of business travel – it will need to demonstrate progress on cost control. **Investor focus:** forward guidance from these airlines will be crucial. If they announce plans to cut capacity growth (to boost fares) or raise fees, that signals a strategy to restore margins (potentially supporting airfare prices). Alternatively, if they bank on fuel prices coming down (which they have slightly in October) and demand staying strong, they might not cut flights – but that could mean

continued margin pain if fares don't rise. In short, AAL and LUV will provide insight into **how long airfare inflation can persist**. The premium carriers have kept prices high, but the mass-market carriers seem to be hitting a ceiling. If even after summer's peak season they report losses, it suggests the industry may need to moderate capacity (which ultimately could stabilize or lift fares). For consumers, airfare has been a volatile component of inflation (down in 2020, then soaring, now fluctuating). Any commentary like "we see improving pricing power into the holidays" from American, or "leisure demand is normalizing and we'll match capacity accordingly" from Southwest, will be parsed as signals on the **direction of travel costs** ahead.

Tech and AI Sector Earnings: A number of high-profile technology and semiconductor companies report this week, and their results will help gauge the **impact of AI investments** and the state of tech demand. Here are the ones to watch:

- **Netflix (NFLX)** – Reports Tuesday, Oct. 21. The streaming video leader has already pre-announced strong subscriber growth for Q3 after its password-sharing crackdown and the rollout of its ad-supported tier. Wall Street expects **EPS of about \$6.96** (a big +29% YoY jump) on revenue of **~\$11.5 billion** (+17% YoY) ⁸⁰. Such growth, if achieved, is striking in a decelerating economy and speaks to Netflix's unique position – it's both benefiting from secular trends (cord-cutting, global expansion) and exercising pricing power (they've raised prices in many regions, and are now monetizing account sharing). An operating margin of ~31% is anticipated ⁸¹, up from ~25% a year ago, reflecting both cost discipline and higher revenue per member. **Key focus:** The market will be laser-focused on Netflix's subscriber additions and its outlook for Q4. Recently, Netflix's cheaper ad-supported plan has gained traction, and ad revenue (still nascent) is growing – a positive for diversification. If Netflix beats on earnings, it likely means two things: **1)** its crackdown on password sharing yielded more new paying users than expected (bullish for revenue), and **2)** content spending was kept in check or timed later, boosting near-term margins. Conversely, any miss might indicate slower uptake of new subscribers, or perhaps FX impacts (a strong dollar can hurt their international revenue). **Expert sentiment** is bullish – many analysts have raised targets after Netflix's last subscriber surge. One caution is that Netflix's stock has run up, so expectations are high. A notable point is that Netflix's success in increasing monetization without spurring massive churn could hint that **streaming prices could rise further** across the industry – a small piece of the overall inflation puzzle (media/entertainment costs). But for consumers, paying ~\$15 for Netflix might feel justified if it remains the primary entertainment source. In summary, look for Netflix to potentially **beat estimates and guide Q4 strongly**, which would underscore that certain digital services can thrive even as others slow. Any mention of them planning another price hike in 2026, or their view on consumer willingness to spend on streaming, will be extrapolated to the broader discretionary spending environment.

- **SAP SE (SAP)** – Reports Wednesday, Oct. 22. Europe's largest software company (enterprise ERP and cloud) will be closely watched as a proxy for corporate IT spending and cloud transition costs. In Q3, SAP's **cloud revenue is projected to surge ~22%** (to ~€5.3 billion) ⁸², now making up over half its total sales. Consensus for overall revenue is around **\$9.1 billion** (≈€8.6 billion) with **EPS about \$1.71** (roughly flat YoY) ⁸³. SAP has been investing heavily in its cloud offerings (S/4HANA Cloud etc.), and while that drives growth, it also depresses margins in the transition period (cloud subscriptions have lower margin than legacy licenses initially). Investors will want to see continued strong cloud backlog and any updates on AI integration into SAP's products (they announced AI partnerships earlier). **From an inflation angle:** SAP's results may reflect **wage inflation in tech** – engineering talent costs have risen, especially in Europe. If SAP had to spend more on R&D and cloud infrastructure, margins might

be under pressure. However, SAP has also been raising prices for its software maintenance and cloud services (they enacted price increases tied to inflation rates last year). So one question: are clients accepting higher software bills, or pushing back? SAP's CEO in prior quarters said customers so far have tolerated price hikes given the value SAP software provides. If that remains true, it shows **B2B tech inflation** sticking – enterprise software contracts often have inflation-indexed escalators. Geographically, watch SAP's performance in Europe (where economic growth has been lukewarm) vs. the U.S. and Asia. Any resilience in Europe would be encouraging for global IT demand. **Earnings expectations:** SAP has beaten forecasts recently and even raised its full-year outlook in Q2. The stockstory analysis notes Q3 EPS guidance was around \$1.73 and revenue €8.59B, slightly above analyst estimates ⁸³ ⁸⁴ – so SAP might come in a touch ahead if execution was good. Investors will look for confirmation that **cloud momentum is offsetting any macro headwinds**. If SAP strikes an upbeat tone (perhaps even targeting ~26–28% cloud growth for 2025, per its guidance ⁸⁵), it bodes well for other enterprise-tech names and suggests companies are still prioritizing digital transformation spending despite economic uncertainties. On the flip side, any sign of clients delaying projects or seeking shorter contracts to save money would hint at belt-tightening (and be a warning sign for IT budgets in 2026). Overall, SAP's results should be **solid**, and its take on Europe's economy (given its German HQ) will be interesting amid the region's own inflation fight.

- **Tesla (TSLA)** – Reports Wednesday, Oct. 22. Tesla is always a highlight, blending themes of consumer demand, tech innovation, and commodity costs. This quarter, however, Tesla's earnings are expected to **decline significantly year-on-year** due to the company's strategic price cuts on its EVs. Analysts forecast **EPS around \$0.50–\$0.55** (down from \$0.72 a year ago) ⁸⁶ on revenue of roughly **\$24–25 billion**. Tesla already reported record Q3 deliveries of 497,000 vehicles, which beat estimates by >50k units ⁸⁷ – a huge volume jump (deliveries +27% YoY). However, that surge was fueled by aggressive price reductions and incentives (and a pull-forward of demand ahead of an EV tax credit expiration) ⁸⁷ ⁸⁸. The net effect: **automotive gross margin** is expected to be the lowest in years (Q2 margin was 18.2%, and Q3 might be similar or slightly lower). **Key issue:** how low did margins go, and has Tesla reached a floor on pricing? CEO Elon Musk has framed the price cuts as necessary to spur adoption and fend off competition, accepting lower profit per car in the short term. This quarter will show just how much those cuts bit into profits. If Tesla's EPS comes in at \$0.50, that's ~30% below last year – a big drop for a growth company. The stock, however, has remained buoyant (it's up this year) on the back of the AI hype (Tesla's self-driving and robotaxi potential) and belief that volumes will drive future profit once economy of scale kicks in. **Market expectations:** somewhat mixed. Options markets imply a volatile reaction (as usual, perhaps a ~7% post-earnings move priced in). A **beat** could occur if Tesla managed to cut costs (manufacturing efficiencies, cheaper battery materials) enough to mitigate the ASP declines. For instance, if EPS lands around \$0.60+, that would surprise to the upside and suggest Tesla found ways to preserve more margin (or generated more regulatory credits revenue). Additionally, Tesla's energy storage business hit record deployments (12.5 GWh last quarter) ⁸⁹ – any outperformance there could boost earnings. Conversely, a **miss** (e.g. EPS in the 40-cent range) might indicate the price cuts were even more costly profit-wise, or that operating expenses for new projects (Cybertruck launch, AI compute, etc.) jumped. Beyond the Q3 numbers, **guidance and commentary** from Musk will be pivotal. Investors will want updates on: the Cybertruck (on track for initial deliveries by end of year?), the outlook for further vehicle price adjustments, and how Tesla sees EV demand holding up in an era of higher interest rates (which make auto loans more expensive). Musk's tone on the conference call can move Tesla's stock as much as the earnings themselves. **Inflation connections:** Tesla's pricing strategy has actually been a deflationary force in the auto industry – rivals like Ford had to cut EV prices to keep up. If Tesla signals it's done cutting for now

(maybe because battery metal costs have stabilized and it wants to protect margins), that could relieve some downward pressure on auto prices industry-wide. Additionally, Tesla might comment on input costs: lithium prices have fallen this year, which helps EV makers. If Tesla acknowledges significantly lower battery costs, that could be a harbinger of **cheaper EVs ahead** (good for adoption, potentially disinflationary for auto sector). On the other hand, if they mention any commodity spikes or rising labor costs (Tesla did grant factory worker raises in some locations), that's notable. All told, Tesla's results will be a microcosm of **tech-driven deflation vs. cost inflation**: high-tech manufacturing aims to cut costs (driving prices down), but economic moats and brand power can also allow high margins. This quarter, Tesla leaned toward price cuts (deflation) to grab share – we'll see how Wall Street reacts to that trade-off.

- **Texas Instruments (TXN)** – Reports Tuesday, Oct. 21. TI is a major analog semiconductor maker whose chips go into cars, industrial equipment, personal electronics, etc. It's often seen as a bellwether for overall electronics demand. Notably, TXN had been in a downturn due to inventory corrections – its Q2 sales fell 13% YoY. Q3, however, is expected to show the start of a rebound. **TI's own guidance** was for Q3 revenue in the range **\$4.45–\$4.80 billion** ⁹⁰ and EPS \$1.36–\$1.60 (a wide range) ⁹¹. The **consensus** is near the midpoint: about **\$4.65 billion revenue** (+~12% QoQ, +11.9% YoY) ⁹² and **EPS ~\$1.49** (essentially flat YoY, as Q3 2024 was around \$1.47) ⁹³. This suggests analysts believe TXN's business hit bottom and is now growing again, thanks especially to **automotive and industrial demand**. Auto makers need more chips per vehicle (for EVs, ADAS, etc.), and TI is a leader there. If TXN meets or exceeds these estimates, it will confirm that the semiconductor cycle (at least for analog/power chips) is on upswing. **What it means for inflation**: semiconductors were an area of shortage and inflation in 2021–2022 (chip prices soared, leading to higher car prices, etc.), but that flipped to oversupply in 2023 for many chip types (memory, PC chips). For analog chips, supply has been tight but improving. If TI's sales are rising, it could indicate that **supply constraints are easing** (so volume is up) and/or end-demand is improving. TI's pricing is typically stable – they don't fluctuate prices quarter to quarter much. However, one metric to watch is their **inventory and lead times**. Shorter lead times and rising inventory would imply customers aren't scrambling for chips like before (a normalization that helps reduce **goods inflation** like car parts). Conversely, if TI says "our books are filling and capacity is still limited," it hints some pockets of chip shortage persist (could keep certain electronic prices elevated). **Street sentiment**: fairly neutral to positive. Zacks noted slight upward revisions to TI's estimates into the print ⁹². TI's stock will react to its forward guidance as much as Q3 – if they guide Q4 above consensus, it's a green light that the worst is over for the chip slump. That would be taken positively by markets and also suggests that the **tech inventory glut has cleared**, removing a deflationary weight (indeed, chip prices might even stabilize or rise if demand outstrips supply in some areas). All in all, expect TI to report a respectable quarter; any mention of the word "strengthening" in autos/industrial will be seen as a broader economic positive. One more angle: TXN is known for good cost control and has been building new fabs in Texas – CapEx and cost inflation on those projects (materials, construction labor) could be discussed, as they eventually factor into chip costs.

- **Lam Research (LRCX)** – Reports Wednesday, Oct. 22. Lam is a leading maker of semiconductor fabrication equipment (the complex machines used in chip fabs, especially for memory chips). It sits at the volatile upstream of the chip supply chain – orders can swing widely based on how much chipmakers like Samsung, TSMC, and Micron are spending. Lam's results will reflect the **big rebound in AI-related chip capital spending**. Notably, Lam itself already pre-announced some guidance: management indicated Q3 revenue would be ~\$4.72 billion (+24% YoY) and gave EPS guidance of

\$1.20 (non-GAAP) at the midpoint ⁹⁴ ⁹⁵ . This was above analysts' prior estimate of ~\$1.00 EPS ⁹⁴ – effectively an **upbeat pre-release**. So the market is expecting a **beat** from Lam, and indeed some sites show consensus moving up to around \$1.20. The drivers: memory chipmakers (Lam's key customers) have started to invest again after a deep slump, and logic chipmakers are pouring money into capacity for AI accelerators (GPUs, etc.). For example, ASML (a peer in lithography) noted strong orders from AI chip fabs ⁹⁶ . Lam's tools are heavily used in NAND Flash and DRAM production – areas that were in downturn but appear to be bottoming. This means Lam's fortunes are turning faster than thought. **Implication for inflation:** when chipmakers invest in new equipment, it eventually increases chip supply, which is disinflationary for chip prices. So the fact that Lam is doing well suggests **the supply side is expanding** to meet demand (especially for AI chips and next-gen memory). In the short term, though, that capex boom can actually cause bottlenecks for equipment availability (Lam and peers have long lead times). Lam's commentary may include discussion of **their supply chain** – last year they had issues meeting demand due to component shortages. If they say those issues are resolved and they're shipping faster, it's another sign that the broader supply-chain snarls are largely over (good for taming goods inflation). Conversely, if Lam still sees constraints (perhaps on skilled labor to build tools, or high input costs like specialized ceramics, lasers, etc.), that indicates some inflationary pressures linger in high-tech manufacturing. Lam is also affected by U.S.–China export controls (it cannot sell advanced fab tools to China freely) ⁹⁷ . Recent rule tweaks might have impacted orders. Investors will look for whether demand from other regions (U.S., Korea, Japan) is offsetting the China drop. So far, Lam's tone is positive: they outperformed consensus, and JPMorgan analysts commented that fears of a worse 2026 have been “put to rest” with flat guidance and optimism for growth beyond ⁹⁸ . We expect Lam's earnings to underscore a theme: **the AI boom is driving big capital investments**, which near-term is a boon for companies like Lam (and is why their stock hit fresh highs). Over the longer run, that expansion should alleviate some of the extreme chip shortages that drove inflation in electronics – essentially, supply will catch up to high demand. So Lam's strong results are a signal of **confidence in tech supply capacity growth**. From an investing angle, any hints from Lam about 2026 WFE (wafer fab equipment) spending recovering will likely lift the whole chip equipment group. If there's a caution, it might be that memory chip prices are still below cost for some manufacturers – they are buying equipment now in anticipation of a price recovery. Should that recovery falter, orders could slow again. But at least for now, Lam is riding a cyclical upswing.

- **Intel (INTC)** – Reports Thursday, Oct. 24. Intel's turnaround has been closely followed as a barometer of U.S. manufacturing and tech competitiveness. After several grim quarters of losses, Intel managed a surprise profit last quarter and is roughly breakeven this year. For Q3, Intel's own guidance was optimistic: midpoint **revenue \$13.1 billion** and EPS about \$0.00 (flat) ⁸⁴ , which was above the prior Street estimate of ~\$12.6B and ~\$0.07 EPS ⁸⁴ . Now, **consensus is aligned around \$13.1B and \$0.00 EPS**, essentially expecting Intel to hit its targets. If it does, it will mark a substantial improvement from the \$-0.10 loss in Q2 and the large loss a year ago. The improvement comes from a few factors: the PC market has stabilized (after a big inventory correction, back-to-school PC demand helped), Intel's data center CPU business is launching new products (Sapphire Rapids chips gaining traction), and Intel has aggressively cut costs (layoffs, spending cuts). Additionally, Intel is benefiting from the AI trend indirectly – while it doesn't sell the hottest AI chips (GPUs), the surge in cloud spending on AI may also drive some incremental demand for traditional servers (where Intel CPUs are used alongside accelerators). **Key points to watch:** Intel's **gross margin**, which plunged below 40% last year but guidance implied recovery to ~43-44%. Any beats there would signal better cost-of-goods control or product mix. Also, Intel's commentary on its foundry business (making chips for others) – they recently scored a deal to make AI chips for Amazon AWS ⁹⁹ . That could open a new revenue stream. If

Intel talks up foundry customer traction, it's a positive sign for utilizing their capacity (important for long-term profitability and for U.S. semiconductor self-reliance goals). **Inflation context:** Intel's world illustrates a couple of things. It had been facing high **input costs** (both materials and a lot of fixed cost per chip when volumes were down). As volume picks up, unit costs fall (economies of scale), which is deflationary for chip prices. Also, Intel has been helped by the **CHIPS Act subsidies** – essentially government funding easing the financial burden of fab expansion (their new fabs in Arizona and Ohio). Such subsidies don't directly show up in earnings, but they enable Intel to invest without raising chip prices as much as they otherwise might. On the flip side, Intel has warned that the talent shortage and labor cost for building fabs is high – that's an inflationary aspect in the tech manufacturing sector. But near-term, Intel is more about execution than pricing – it actually lowered some chip prices earlier to gain back market share from AMD (which is deflationary for that segment of tech). **Earnings outlook:** The bar is set for a small profit – if Intel delivers, it will mark its first breakeven/positive quarter in a year. An **earnings beat** (say, \$0.05 EPS) could happen if PC demand was better than expected or if cost cuts provided more boost. There's chatter that the Q3 PC market was slightly above forecasts, which could help. A **miss** would raise doubts about CEO Pat Gelsinger's turnaround plan (though one quarter isn't make-or-break). Intel also might give preliminary thoughts on Q4 and 2025 – any hints of returning to annual profitability next year would be taken very positively. The stock has rallied >30% from lows on hopes the worst is over. So far, that seems to be the case. For the broader market, Intel's stabilization is a feel-good story about a legacy manufacturer adapting, and it suggests the electronics glut has cleared (so much that a company that was oversupplied is now selling again). In terms of inflation, one could say the **chip price war** between Intel and AMD has kept a lid on high-end CPU prices – which is good for data center operators and PC buyers (tech deflation at work). We'll see if either company signals plans to hike prices next year; given fierce competition, they might not, which means one component of tech costs remains subdued. In summary, expect Intel to show incremental progress – not booming results, but a foundation that maybe, just maybe, paves the way for growth in 2024 if the economy avoids a hard landing.

Bottom Line: The upcoming week will feature crucial inputs for investors' calculus. **On the economic front,** CPI and other data will either confirm or challenge the notion that **inflation is gradually cooling** (with consensus looking for a mild uptick largely due to energy). Any big surprises could re-price Fed expectations, swinging both bonds and stocks. **On the earnings front,** results from consumer giants, industrials, and tech firms will tell us how companies are **navigating the current inflation environment** – whether they're able to maintain pricing power, whether cost pressures are easing, and how demand is holding up. Notably, companies like Coca-Cola and Hilton will reveal if consumers are still absorbing higher prices, while Tesla, Netflix, and chipmakers will show how technological and competitive forces are influencing prices in their industries (e.g. EVs getting cheaper, streaming perhaps getting pricier, chips in flux). By Friday, we'll have a much clearer picture of **where inflation stands and where it's heading:** both from the hard data (CPI, PMIs) and the soft data (corporate guidance and anecdotes). This combined insight will set the tone for the **final stretch of 2025** – determining whether the Fed likely stays on hold, and whether the market's recent optimism (stocks have been rallying on Goldilocks hopes) is justified. Stay tuned – it's a big week for both Wall Street and the economy, with inflation at the center of it all.
